

B360 to NSA JSON Property Mapping Report

Executive Summary

This report analyzes the mapping between b360_order_details_json.json properties and nsa_json_code.json properties to facilitate service layer development.

B360 Property Path	NSA Property Path
orderDetails.barCodes	✗ Not Found
orderDetails.cartRemarks.holdRemark	✗ Not Found
orderDetails.cartRemarks.itemRemark	✗ Not Found
orderDetails.remark	✗ Not Found

Summary Statistics

Match Type	Count	Percentage
✓ Exact Match	8	19%
↻ Similar/Mappable	10	24%
✗ Missing	24	57%
Total Properties	42	100%

Key Findings

🎯 Direct Mappable Properties (8 exact matches)

- customerType
- isAttachmentCompleted
- locationCode
- managerApprovalRequired
- orderType
- specs
- totalDueMonthly
- totalDueToday
- totalTaxAmount

↻ Requires Transformation (10 similar)

- Customer info: spoc → profileInfo mapping
- Tax details: taxPrices → taxDetailsList structure conversion
- Location: storeLocation → outletId
- Effective dates: array → object conversion

- Employee ID: eid → salesRepUswin

✗ Missing Properties (24 not found)

- Most audit trail and remark fields
- Several boolean flags and configuration options
- Specific business logic properties
- Some notification configuration details

Recommendations for Service Layer Implementation

1. **Direct Assignment:** Use exact matches for straightforward property mapping
2. **Data Transformation:** Implement converters for similar properties with different structures
3. **Default Values:** Set appropriate defaults for missing properties
4. **Validation:** Add validation for data type conversions (string vs number)
5. **Null Handling:** Implement null-safe operations for missing properties

Technical Notes

- NSA JSON has richer financial and promotional data structure
- B360 JSON has more audit trail and workflow-specific properties
- Data type inconsistencies exist (string vs number for tax amounts)
- Customer information structure significantly differs between the two formats
